Sequence 1, Application US/08057162B

Sequence 1, Application US/08057162B

Patent No. 5686075

GENERAL INFORMATION:

APPLICANT: Taubman, Martin A.

APPLICANT: Smith, Daniel J.

TITLE OF INVENTION: SYNTHETIC PEPTIDE VACCINE FOR DENTAL CARIES

NUMBER OF SEQUENCES:

CORRESPONDENCES:

ADDRESSEE: Hamilton, Brook, Smith & Reynolds, P.C.

STREET: Two Militia Drive

CITLE Massachusetts

COUNTRY: Lexington

STATE: Massachusetts

COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   COMPUTER READABLE FORM:

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/057,162B
FILING DATE: 30-APR-1993
CLASSIFICATION: 424
PRIOR APPLICATION DATA:
APPLICATION NUMBER: US 07/877,295
FILING DATE: 01-MAY-1992
ATTORNEY/AGENT INFORMATION:
NAME: Wagner, Richard W.

Sequence 11, Application US/0995749A

Patent No. 6667026

GENERAL INFORMATION:
APPLICANT: VAN GEEL-SCHUTTEN, GERRITDINA HENDRIKA
APPLICANT: BIJKHUIZEN, LÜBBERT
APPLICANT: RAHAOUI, HAKIM
APPLICANT: LEER, ROBERT-JAN
TITLE OF INVENTION: NOVEL GLUCOSYLTRANSFERASES
FILE REFERENCE: BO43388-CIP
CURRENT APPLICATION NUMBER: US/09/995,749A

CURRENT FILING DATE: 2001-11-29
PRIOR APPLICATION NUMBER: EPO 00201871.1
PRIOR PILING DATE: 2000-06-28

PRIOR PILING DATE: 2000-06-25

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Description

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mutans glucosyltransferase (GTP) enzyme. AAM34157 and AAM34158 are from the artalytic domain of GTP, while AAM34167 and AAM34158 are from the artalytic domain of GTP. while AAM34167 als from the GTP surface can all be used in the immunogenic composition of GTP. These sequences can all be used in the immunogenic composition of the invention. The composition of the invention can alternatively comprise one or more of these sequences linked to a lysine core matrix (see AM434161-M34165). A composition comprising one of these sequences can be administered to a mammal to raise an immune response, in a method for interfering with the enzymatic activity of streptococcal consistion of the mammal. The immune response results in reduction of the mammal. Compositions containing AAM34156 specifically interfere with the glucan-binding activity of the streptococcal strains in the glucan-binding activity of the streptococcal glucosyltransferase. The peptides can also be used in vaccines for preventing dental caries in mammals. (Updated on 25-MAR-2003 to correct PF field.)

This sequence represents a glucosyltransferase (GTF) immunogenic epitope, and can be used in the immunogenic composition of the invention. The immunogenic composition (A) comprises at least one streptococcal glucan (SG) and at least one component (I) covalently coupled, (in)directly, to SG. (A) elicits antibodies (Ab) to both SG and (I). (A), and related compositions, are used to induce an antibody response to cariogenic bacteria, collectively called "mutans streptococci" (i.e. any of Streptococcus mutans, S. rattus, S. cricetus or S. sobrinus), especially compressed of caries, in humans or other animals. The composition can therefore be used for the treatment or prevention of caries (particularly dental caries). Abs raised against (A) can be used: (a) to detect SG, and (b) for passive immunisation, e.g. applied directly to the surface of certects. SG is a poorly immunogenic type 2 T-cell independent antigen but when coupled to (I) it produces a conjugate which induces significant immunity to both components, resulting in immunological memory and longical asting antibody production against SG, in adults and children
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

/label= GTF antigenic peptide #2 (see AAW34157)
/note= "attached to the dendritic polylysine core via the
alpha-amino group of Lys(26); a second copy of the
antigenic 25-mer is linked to Lys(26) via the omega amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "the alpha amino acid group of Lys(27) forms a peptide linkage with the carboxyl amino group of Lys(26); the omega amino group of Lys(27) forms a peptide bond
                                                                                                                                                                                                                                                                                   New composition comprising a fragment of a glucan binding protein-B (GbpB) that binds to MHC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing
                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB-derived peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           group, and to a second via the omega amino

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of a catalytic domain peptide fragment of Streptococcus mutans glucosyltransferase. The peptide can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions comprise a major histocompatibility complex (MHC) class I protein-binding peptide from Streptococcus mutants glucan binding protein-B (GbpB) covalently linked with a (preferably catalytic domain) peptide subunit of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Biepticopic or multieptitopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in passive immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAW34161-W34165 represent the Streptomyces mutans glycosyltransferase (GTF) enzyme immunogenic fragments shown in AAW34156-W34160 linked to a polylybaine core. AAW34157 and AAW34158 are from the catalytic domain of GTF, while AAW34160 is from the GTF surface domain. AAW34156 and AAW34159 are from the glucan-binding domain of GTF. These sequences, and the immunogenic composition of the invention. A composition comprising one of these sequences can be administered to a mammal to raise an immune response, in a method for interfering with the enzymatic activity of streptococcal glucosyltransferase in a mammal. The immune response results in reduction of the colonisation or accumulation of mutans streptococcal strains in the mammal. Compositions containing AAW34156 specifically interfere with the glucan-binding activity of the specifically interfere with the glucan-binding activity of the vaccines for preventing dental caries in mammals. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                      glucosyltransferase I (GTF-I). Peptide fragments of GTF-I, especially from the catalytic domain of the polypeptide, can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions comprise a major histocompatibility complex (MHC) class II protein-binding peptide from S. mutants glucan binding protein-B (GbpB) binding peptide from S. mutants glucan binding protein-B (GbpB) covalently linked with a peptide fragment of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or muticapitopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in passive immunisation.
                                                                                                                           Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                                                                                               The present sequence is the protein sequence of Streptococcus sobrinus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The DNA sequence from Streptococcus sobrinus strain 6715 encodes glucosyltransferase1 (and mutants). The DNA was obtd. by treating S. sobrinus 6715 with mutanolysin, extracting the chromosomal DNA, partially digesting with Sau3AI and fractionating on agarose gel. The 3-5 kbp digesting with was ligated into pUC18 and E. coli JM109 transformed with it. A GT-1 expressing clone was isolated and sequenced. The clone may be used in the development of a drug for dental caries
                                                    The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immuniting mammals against dental caries. This sequence corresponds to a Streptococcus sobrinus GbpB protein of the invention.
microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequence glucosyl:transferase-I - comprises Streptococcus sobrinus sequence with at least one nucleotide added or deleted.

```
an anti-caries agent composed of a monoclonal antibody produced by Streptococcus mutans, particularly mouse-hybridoma MHP126 (FERM P-17567) or mouse-hybridoma MHP136 (FERM P-17567), against an enzyme having inhibitive activity against water insoluble glucan synthetase of glucosyl transferase-B. The monoclonal antibody specifically inhibits water transferase-B and is used in the immunocherapy of dental caries. This sequence represents a Streptococcus mutans produced glucosyl transferase-B and is used in the immunocherapy of dental caries. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-caries agent composed of a monoclonal antibody against an inhibitory enzyme against water insoluble glucan synthetase of glucosyl transferase-B (GTF-B) of Streptococcus mutans.
                                                                                                                                                                                                                      Antibody; dental caries; water insoluble glucan synthetase; anti-caries; glucosyl transferase-B; immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention relates to a monoclonal antibody against dental caries and

```

```
Anti-caries agent composed of a monoclonal antibody against an inhibitory enzyme against water insoluble glucan synthetase of glucosyl transferase-B (GTF-B) of Streptococcus mutans.
                                                                                                         Antibody; dental caries; water insoluble glucan synthetase; anti-caries; glucosyl transferase-B; immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a monoclonal antibody against dental caries and an anti-caries agent composed of a monoclonal antibody produced by Streptococcus mutens, particularly mouse-hybridoma MHP126 (FERM P-1756)) or mouse-hybridoma MHP136 (FERM P-1756), against an enzyme having inhibitive activity against water insoluble glucan synthetase of glucosyitransferase-B. The monoclonal antibody specifically inhibits water insoluble glucan synthetase of Streptococcus mutans produced glucosyl transferase-B and is used in the immunotherapy of dental caries. This sequence represents a Streptococcus mutans monoclonal antibody-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Glucosyltransferase; enzyme; vaccine; anticaries; epitope; immunogen.

The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB protein of the invention.
                                                            New composition comprising a fragment of a glucan binding protein-B (dpbB) that binds to MHC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                                                                                                                                                                                                                                        61.5%; Score 80; DB 9; 64.0%; Pred.                                                                                                                                                                                                                                                                                        The present sequence is the protein sequence of Streptococcus mutans glucosyltransferase-C (GTF-C). Peptide fragments of GTF-C, especially from the catalytic domain of the polypeptide, can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions comprise a major histocompatibility complex (MHC) class II proteinbinding peptide from S. mutants glucan binding protein-B (GDpB) covalently linked with a peptide fragment of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or multicpitopic polypeptides can be prepared synthetically or by
                                                                                                                                                                                          Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                      recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in passive immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Claim 36; Page; 44pp; English

The invention an isolated protein comprising a glucosyltransferase (GTF)

B polypeptide having changes at position from 1448V, D457V, D567T, CK1014T, D457V/D571K, T014T, D567T, D657T, D667T, require input materials that produce chemical effluents, paper manufacture utilising the glucan produced by GFF, which utilises biologically produced input materials, is more cost-effective and environmentually friendly. Moreover, glucans also exhibit thermoplastic properties and impart gloss to the paper during coating step. The present sequence represents a GTFB mutant of the invention. Note: The present sequence is not shown in the specification but was created by the indexer using the GTFB sequence appearing as AAU98027 and the information in and latexes in paper manufacture. Unlike prior art techniques, which

13-SEP-2005 (Rel. 48, Last annotation update)
Glucosyltransferase-I precursor (EC 2.4.1.5) (GTF-I) (Dextransucrase)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            "Peptide sequences for sucrose splitting and glucan binding within Streptococcus sobrinus glucosyltransferase (water-insoluble glucan synthetase).", 73:989-996(1991).
-!- FUNCTION: Production of extracellular glucans, that are thought play a key role in the development of the dental plaque because their ability to adhere to smooth surfaces and mediate the aggregation of bacterial cells and food debris.
                                                                                                                                                                                                                                                                                                                                                                                                                     EMBL, M17391, AAC63063.1; -; Genomic_DNA.

                                                                                                                      forms of glucans.
SIMILARITY: Belongs to the glycosyl hydrolase 70 family.
SIMILARITY: Contains 19 cell wall binding repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A repeat (incomplete).
Catalytic (approximate).
1.25 A, 2 B and 5 AC repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Glucan-binding (approximate)

CATALYTIC ACTIVITY: Sucrose + (1,6-alpha-D-glucosyl)(n) = D-fructose + (1,6-alpha-D-glucosyl)(n+1).
SUBCELLULAR LOCATION: Secreted.
NISCELLANDOUS: GTF-1 synthesizes water-insoluble glucans (alpha 1,3-linked glucose and some 1,6 linkages), GTF-5 synthesizes water-soluble glucans (alpha 1,6-glucose). GTF-S synthesizes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ueda S., Shiroza T., Kuramitsu H.K.; "Sequence analysis of the gtfC gene from Streptococcus mutans GS-5."; Gene 69:101-109(1988).

"Sequence analysis of the gtfB gene from Streptococcus mutans.";

"J. Bacteriol. 169:4263-4270(1987).

"J. Bacteriol. 169:4263-4270(1987).

-!- FUNCTION: Production of extracellular glucans, that are thought to play a key role in the development of the dental plaque because of their ability to adhere to smooth surfaces and mediate the aggregation of bacterial cells and food debris.

-!- CATALYTIC ACTIVITY: Sucrose + (1,6-alpha-D-glucosyl)(n) = D-fructose + (1,6-alpha-D-glucosyl)(n+1).

-!- SUBCELLULAR LOCATION: Secreted.

"MISCELLANBOUS: GTF-I synthesizes water-insoluble glucans (alpha 1,3-linked glucose and some 1,6 linkages), GTF-S synthesizes both forms of glucans (alpha 1,6-glucose). GTF-SI synthesizes both forms of glucans.

-!- SIMILARITY: Belongs to the glycosyl hydrolase 70 family.

-!- SIMILARITY: Contains 5 cell wall binding repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This Swiss-Prot entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Procession (1) Acad. Sci. U.S.A. 99:14434-14439(2002).

-! FUNCTION: Production of extracellular glucans, that are thought to play a key role in the development of the dental plaque because of their ability to adhere to smooth surfaces and mediate the aggregation of bacterial cells and food debris.

-! CATALYTIC ACTIVITY: Sucrose + (1,6-alpha-D-glucosyl) (n) = D-fructose + (1,6-alpha-D-glucosyl) (n+1).

-! SUBCELLULAR LOCATION: Secreted.
-! SUBCELLULAR LOCATION: Secreted.
-! Allocate and some 1,6 linkages), GTF-S synthesizes water-soluble glucans (alpha u).
-! Allocate and some 1,6 linkages), GTF-S synthesizes both
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              InterPro; IPR002479; Cell wall bd put.

SIMILARITY: Belongs to the glycosyl hydrolase 70 family.
SIMILARITY: Contains 10 cell wall binding repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Glucosyltransferase-I.
A repeat.
